Function Transformer

* log transform: It is a way to change data that has very large number, very small numbers or a skewed shape. It works by taking the log (or) logarithm of each number in the data which helps to compress the large values in the small ones

When to use:

- Right skewed data
- Some no. are extremly large than other

Other transform: (x is data)

Reciprocal: $\frac{1}{x}$

Square: x^2 ⟶ used for left skewed data

Sq root: $\sqrt{x}$

* Power Transformer:
