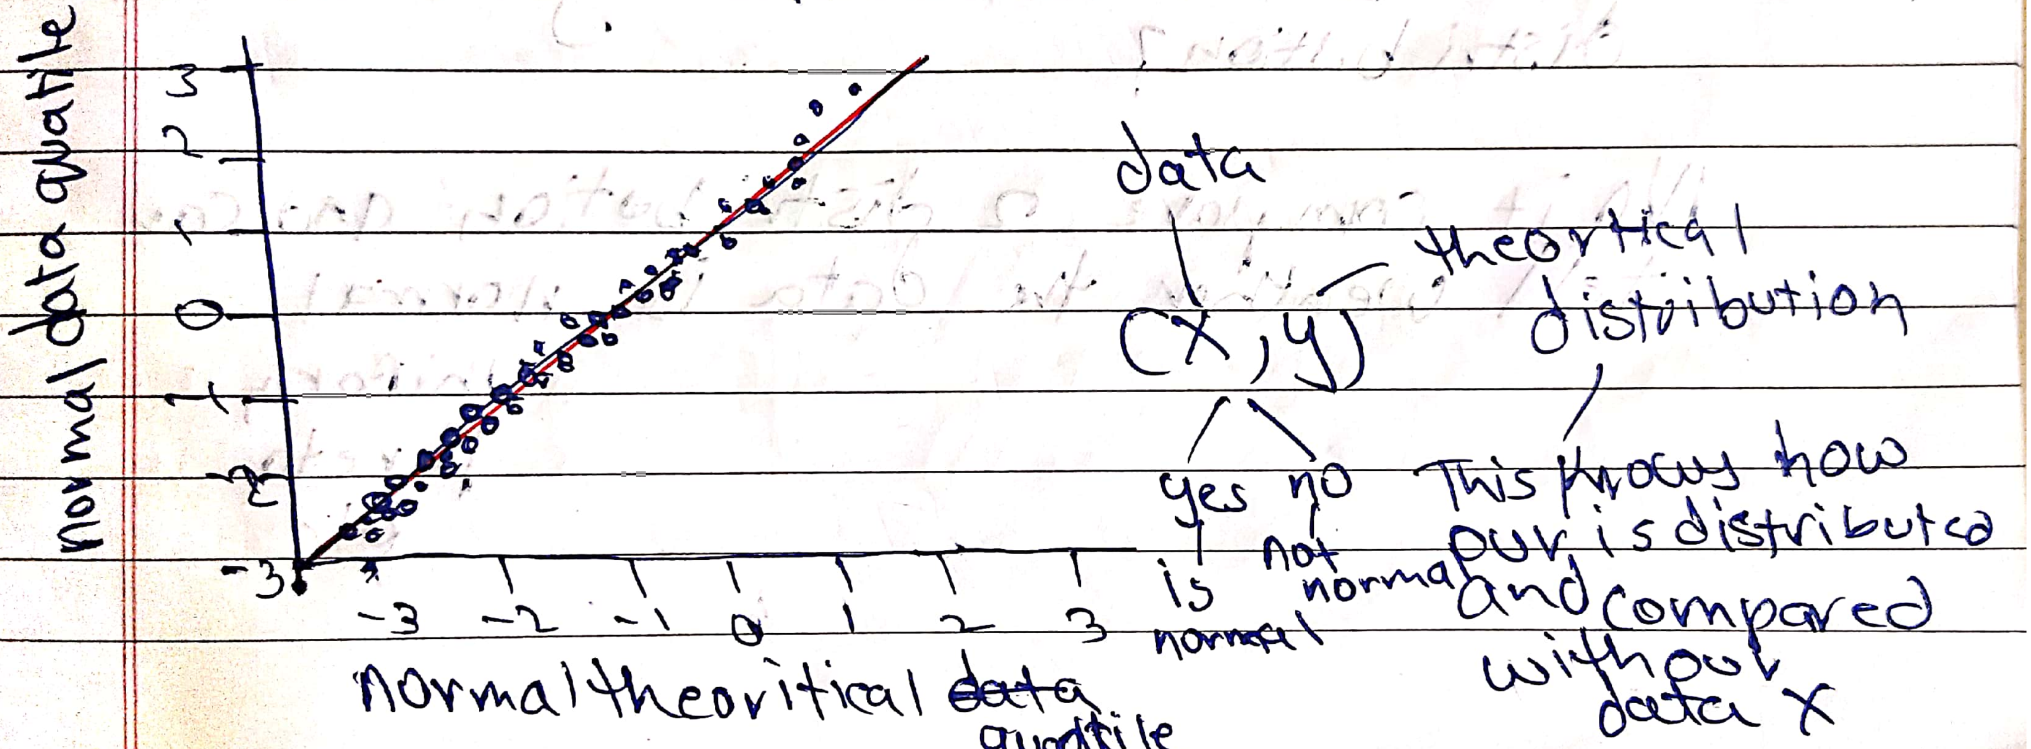
To find weather a ~~plot~~ data is normal we use many method; one of the efficient method is

QQ Plot : A QQ Plot (quantile-quatile plot) Is a graphical tool used to assess the similarity of the distribution of 2 sets of data. It is particularly useful for determining wheather a set of data follows normal distribution.



Scanned with OKEN Scanner

Steps:

firstsort data

i) take theorotical(Y) → then find out its quantile

- 1th
- 2nd
- ⋮
- 100nd

↓

Y - quantile

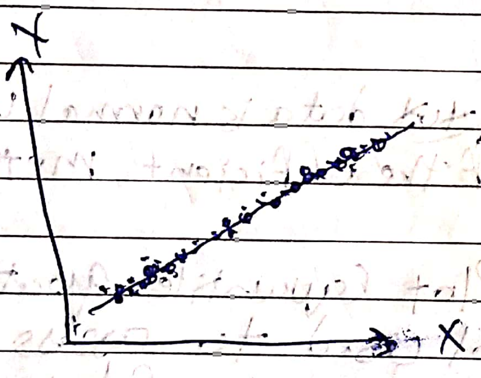
firstsort

ii) take your data(X) → Same find its quantile

X_quantile

iii) (X_quantile, Y_quantile) and plot it

if



if every points come on single line segment then its normal distribution

Is this distribution used only for normal distribution?

No it compare 2 distribution and can tell weather the data is normal

uniform

Pareto

etc.
