Batch ML

Batch ML is a type of ML where we train test models offline and we make model online after testing.

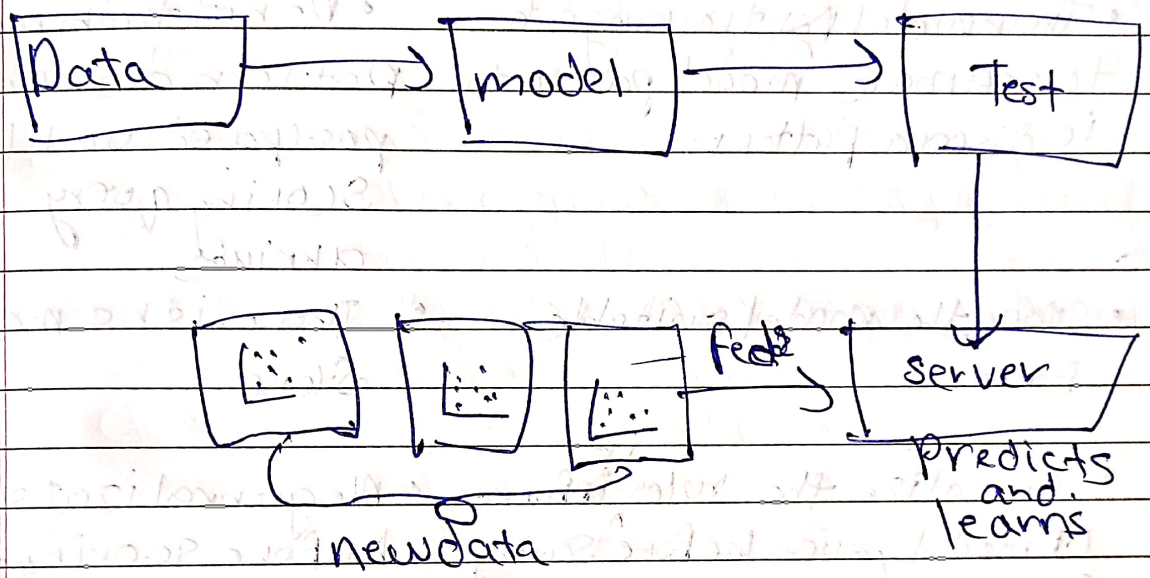

Dis advantage: i) lots of data
ii) hardware limitations
iii) Availibility

machine
Online learning

Online ML is done incrementally where training is done incrementally, where data is given in batches, after every batch train model improves (batch is small chunk of data) while its online on server

data batches ~~th~~ is trained dynamically ~~it~~ on online server ~~improves~~ improves accuracy

Where to use: i) where there is a concept drift
ii) cost effective
iii) faster

Disadvantages: i) tricky to use
ii) Risky
