Types of learning in ML

Instance Based	Model Based
• Data preprocessing from	• Data preprocessing
• Train model for training data to estimate model parameter ie Discover pattern	• Do not train model. Pattern discovering postponed until scoring query arrives
• Store the model suitable form	• There is no model Store
• Generalize the rules in form of model, even before scoring instance seen	• No generalization before scoring. Only Generalize for each scoring instance individually as and when seen
• predict the unseen scoring instance using model	• Predict for unseen Scoring using traing data directly
• Can throw away input / train data after training	• Input / training data must be kept since each query uses part or full set of training observation
• requires less storage	• requires more storage
