Exploratory Data Analysis

- Univariate Analysis: It involves the observation consisting of only one variable or column.
- Bivariate Analysis: It is a statistical method to explore relationship between 2 variable/columns.
- Multivariate Analysis: It is a statistical method to explore relationship between more than 2 variables/columns.

* Data profiling: Its a tool/module in python where it creates a EDA of entire any dataset which has univariate, bivariate, multivariate, correlation and missing values, all represented using scatter plot, heatmap, histogram etc. There is a each variable analysis in this.
